

PACKING SOURCE DATA PACKETS INTO TRANSPORTING PACKETS WITH FRAGMENTATION

Abstract of the Disclosure

5 A communications system and method are disclosed for transmitting packets of
information in at least one first format over a communications link that utilizes packets
of information in a second format. In certain embodiments, the packets of information
in a first format are converted to packets of information in the second format prior to
transmission via the communications link by packing and fragmenting the information
in the first format in a coordinated manner. Embodiments may also utilize packing
10 subheaders and fragmentation control bits in the packing and fragmentation processes.
